Actual Validity Errors

1. **Incorrect document structure:** </html> appears before <body>, leaving the body outside the document element.
2. **Malformed anchor tag:** href=https://www.bigcabal.com lacks quotes around the attribute value. Quoting is the proper correction for this markup.
3. **Incorrect closing anchor syntax:** <a> must be closed with , not .
4. **Invalid abbreviation attribute:** <abbr> uses title, not name, for the expansion of an abbreviation.
5. **Invalid image attributes:** with="300" and height="auto" are not appropriate HTML image sizing attributes. Use width="300" and, if needed, CSS to control the height.
6. **Misnested formatting elements:** <b> is opened inside <code> but closed after </code>. The corrected example uses one <code> element without unnecessary bold formatting.

.

HTML-only improvements

1) **Document language:** lang="en" helps assistive technologies and language-processing tools interpret the page.
2) **Page description:** the meta name="description" element provides a useful summary for search engines and other consumers of page metadata.
3) **Semantic structure:** <main> and <article> identify the primary content and article boundaries.
4) **Image alternative text:** alt gives users of assistive technology a text alternative for the image. The actual description should reflect the real image.
5) **Abbreviation expansion:** <abbr title="lobortis"> identifies the expansion associated with the abbreviated text.
6) **Viewport metadata:** this supports correct mobile rendering.
7) **Explicit button type:** type="button" avoids accidental form submission if the button is later placed inside a form.
